Courtesy of Dr. Martin Rupich, [marty.rupich@amsc.com](mailto:marty.rupich@amsc.com), 978-842-3217, October 31, 2016

		Typical Requirements	Comment
<b>Power Cables</b>			
	Low AC losses - Nonmagnetic substrate High current density per unit width Cabling strain tolerance	$<10^{-8} \text{ J/mA}^2$ $>350 \text{ A/cm}$ Helix	at 60% of $I_c$
<b>REG</b>			
	Controlled current capacity for limiting Stability for transient currents Tailored Impedance	$<10\% I_c$ variation 200% for $\sim 100\text{ms}$ -1 sec $\sim 3\text{-}7 \mu\Omega\text{cm}$ 77K	Through faults Site dependent
<b>Stand-alone FCL</b>			
	High current density per unit width SF 77K High sheet resistance Stability for transient currents	$>300 \text{ A/cm} \times 2$ $\sim 7.6 \mu\Omega\text{cm}$ 90K (23 300K) 200% for $\sim 100\text{ms}$ -1 sec	typical through faults
<b>Electric Power Generators</b>			
	High current density at 2-4 T and 40K Mechanically robust Centrifugal loading Stress tolerance associated with impregnation	$>400 \text{ A/cm}$ $\sim 100 \text{ MPa}$ $>0.1\%$ strain in all directions $>20 \text{ MPa}$ C axis tension	Power Density EM loading 150 m/sec

# Resilient Electric Grid Solutions

Courtesy of Dr. Martin Rupich,  
[marty.rupich@amsc.com](mailto:marty.rupich@amsc.com)

Resilient Electric Grids (REG) are **Distribution Voltage, HTS Cable Systems** designed to be inherently **Fault Current Limiting** and are applied in **Urban Areas** to improve system **Reliability** and **Load Serving** capability.

## Key Applications:

- **Distribution Interconnecting:** Allow the Interconnecting of Urban Distribution Grids to increase reliability and load serving capability while managing fault currents.
- **Small urban substations:** Allow the installation of small, cost effective urban substations that consist of a distribution bus only; bulk power is transported in at distribution voltages

## REG Systems Key Characteristics:

**Power Density:** Transmission Power at Distribution Voltages

**Ease of Siting:** 3-Phases in One Cable and Thermal Isolation make siting easier

**Fault Current Limiting:** FCL capability allows for approaches not available with any other technology.

## *IBAD-MOCVD based REBCO wire on Hastelloy substrate*

Cross-sectional image of a Cu-plated wire

- REBCO formulation:
  - **AP** (Advanced Pinning) – with enhanced in-field performance for B//c, targeting at coil applications such as high-field magnets, SMES, motors/generators
  - **CF** (Cable Formulation) – for cables, transformers, FCL
- $I_c(77K, \text{s.f.})/12\text{mm} = 400\text{-}600\text{A}$ , piece length = up to 500m.
- Variations in width (2-12mm), substrate thickness (30, 50 or 100 $\mu\text{m}$ )  
Ag thickness (1-5 $\mu\text{m}$ ), Cu thickness (10-115 $\mu\text{m}$ ), and insulation
- Bonding conductors : 2x2mm, 2x4mm, 2x12mm (face to face / back to back )
- Product lineup is expanding

# $I_c$ performance of Enhanced A.P wire at 77K/s.f

- Magnetic, non-contact measurement
- High spatial resolution, high speed, reel-to-reel
- Monitoring  $I_c$  at multiple production points after MOCVD
- Capable of quantitative 2D uniformity inspection

# Development progress of 30 $\mu$ m substrate

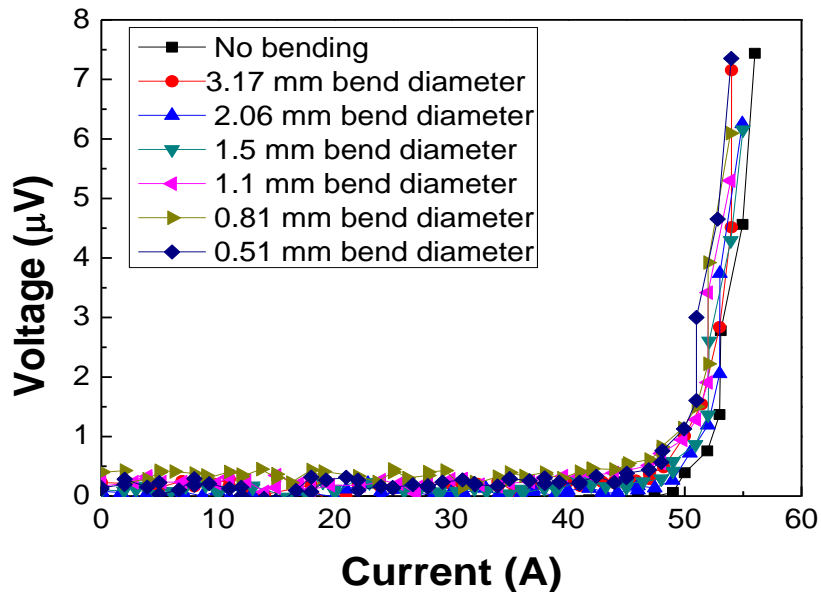

- Base performance of 30 $\mu$ m substrates are comparable to 50 $\mu$ m.

# Additional improvements in $J_e$ with thinner tapes

- 3x  $J_e$  improvement with 25% Zr addition
- Additional 2X  $J_e$  improvement with 2X thicker film  $\rightarrow J_e \sim 1700 \text{ A/mm}^2$  at 4.2 K, 20 T
- Yet another 2X  $J_e$  improvement with  $\frac{1}{2}$  thick tapes  $\rightarrow 25 \mu\text{m}$  total tape thickness! (45  $\mu\text{m}$  with Cu stabilizer)  $\rightarrow J_e$  of **3000 A/mm<sup>2</sup>** at 4.2 K, 20 T feasible!

*Ultrathin REBCO tapes enable ultra-small diameter REBCO wires.*

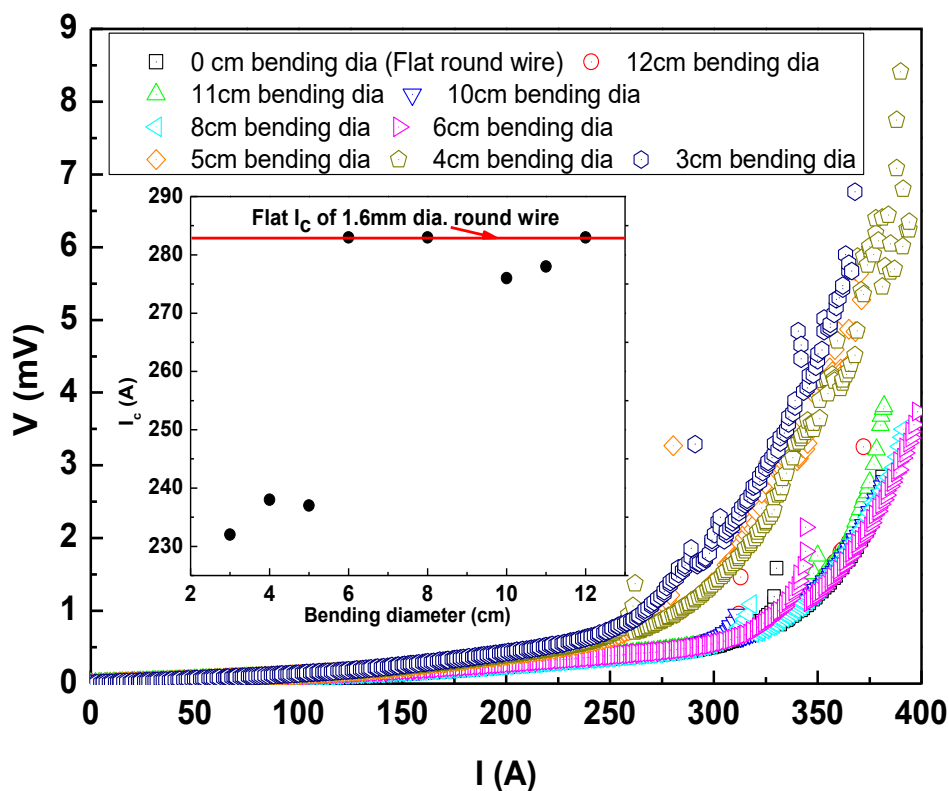

**1.6 mm diameter wire wound on 0.8 mm diameter core, with  $I_c$  of 283 A**

***Ultrathin REBCO tapes can be wound on 0.51 mm diameter without  $I_c$  degradation!***

# Excellent mechanical properties of round ultra-small diameter REBCO wire

3 cm bending diameter

## ARPA-E: The First Seven Years

*A Sampling of Project Outcomes*

CHANGING WHAT'S POSSIBLE

The report can be downloaded here: <http://go.usa.gov/x2V3T>

ARPA-E funded 475 projects the first seven years. ~36 projects made to this list of impact sheet, Two from SC projects

## QUADRUPLING CRITICAL CURRENT IN HIGH TEMPERATURE SUPERCONDUCTOR WIRES

Updated: June 20, 2016

<b>PROJECT TITLE:</b>	Superconducting Wires for Direct-Drive Wind Generators	High Performance, Low Cost Superconducting Wires and Coils for High Power Wind Generators
<b>PROGRAM:</b>	Rare Earth Alternatives to Critical Materials (REACT)	
<b>AWARD:</b>	\$3,298,424	\$5,131,458
<b>PROJECT TEAMS:</b>	Brookhaven National Lab & American Superconductors	University of Houston, SuperPower, Energy2Power & Teco-Westinghouse
<b>PROJECT TERMS:</b>	January 2012 – March 2016	January 2012 – June 2015
<b>PRINCIPAL INVESTIGATOR (PI):</b>	Dr. Qiang Li	Prof. Venkat Selvamanickam

### TECHNICAL CHALLENGE

High performance electric machines, such as motors in electric vehicles or generators in wind turbines, require rare earth elements, particularly Neodymium (Nd) and Dysprosium (Dy) for the electric machines' magnetic components. In wind generators, the need for rare earths is quite large (a generator in a wind turbine contains approximately 100 kg of rare earth materials for every MW of rated power) and is still growing, as both the total amount of installed wind capacity and the average size of each individual wind turbine continue to increase. Price fluctuations over the past decade have shown that rare earth materials are sensitive to supply disruptions, and alternative technologies to mitigate or eliminate the dependence of this energy technology on critical rare earth materials would offer risk mitigation for the continued growth of wind power against potential market risks in the future.

### TECHNICAL OPPORTUNITY

Using high temperature superconductor (HTS) magnets in wind turbines could dramatically reduce the rare earth requirement compared with traditional permanent magnet (PM) generators (from ~100 kg of Nd and Dy MW in a PM generator to ~100 grams of rare earths per MW in an HTS generator). In addition, HTS generators offer better performance and lower weight for large turbines (see Fig. 1)<sup>24</sup> with corresponding lower operational and capital costs. However, historically the highest performance commercially available HTS wire (Rare earth Element Barium Copper Oxide – (RE)BCO) ranged in cost from \$200/kA-m upwards. To be competitive with PM generators, the cost of the HTS conductor must be reduced ~4x, which in turn requires a dramatic increase in the critical current ( $I_c$ , the maximum current that a superconductor can sustain)<sup>25</sup>. Advances in materials design and fabrication techniques make it possible to address this challenge by engineering specific defects, known as flux pinning centers, into HTS wires.

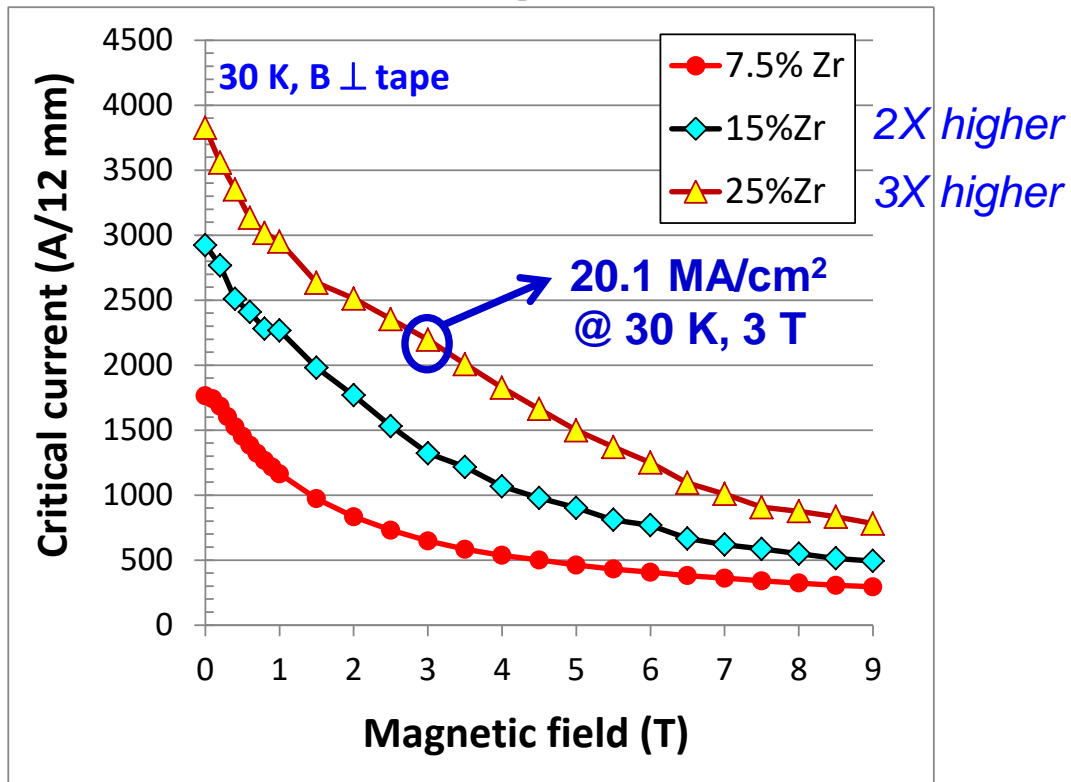

Figure 1. Comparison of overall drivetrain mass for permanent magnet (PM) geared, PM direct drive, and HTS (designed by AMSC) turbines

# Advanced HTS Wires for Energy Applications

## “Solid state catalyst” CeO<sub>2</sub> buffer\*

## Accomplishments :

- Analytical probes developed at BNL providing guidance for improving  $I_c$  (Micro-LEEM, a CFN instrument at NSLS)  
*\*Nature Communications (2013), Scientific Report (2014, Nature)*
- 200%  $I_c$  gain by derivative phase pinning
- 200%  $I_c$  gain by R2R ion irradiation

## Significance and Impact:

- High performance & lower cost wire
- Application of superconductors for magnets, motors, generators, etc

# Effect of ion irradiation on matters

It is desirable to maximize the recoil cross-section

# Consideration of irradiation facility for 2G wire:

- 1) Effectiveness
- 2) Low energy
- 3) Low dosage
- 4) Low heat load (beam heating)

## Importance of keeping irradiation energy as low as possible

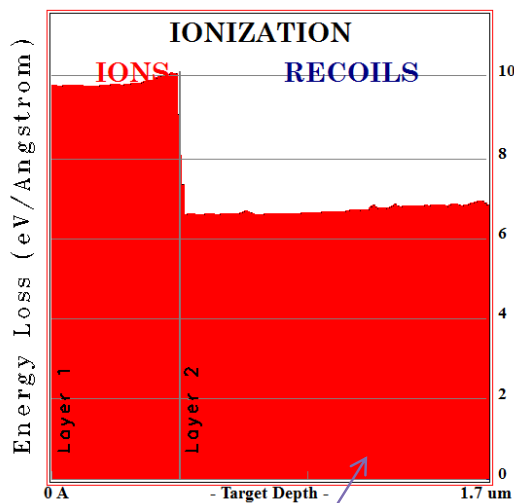

- Lower capital cost
- Required dose is  $\sim 1/E^2$ , i.e. reducing energy by a factor of 10, we increase irradiation rate by 100
- Heat load on the sample is  $\sim E$

# Advantage of heavy ions

1 MeV H<sup>+</sup>

Recoil loss: 0.03 eV/Å•ion

3.5 MeV Ar<sup>+</sup>

Recoil loss: 40 eV/Å•ion

3.0 MeV Au<sup>4+</sup>

Recoil loss: 300 eV/Å•ion

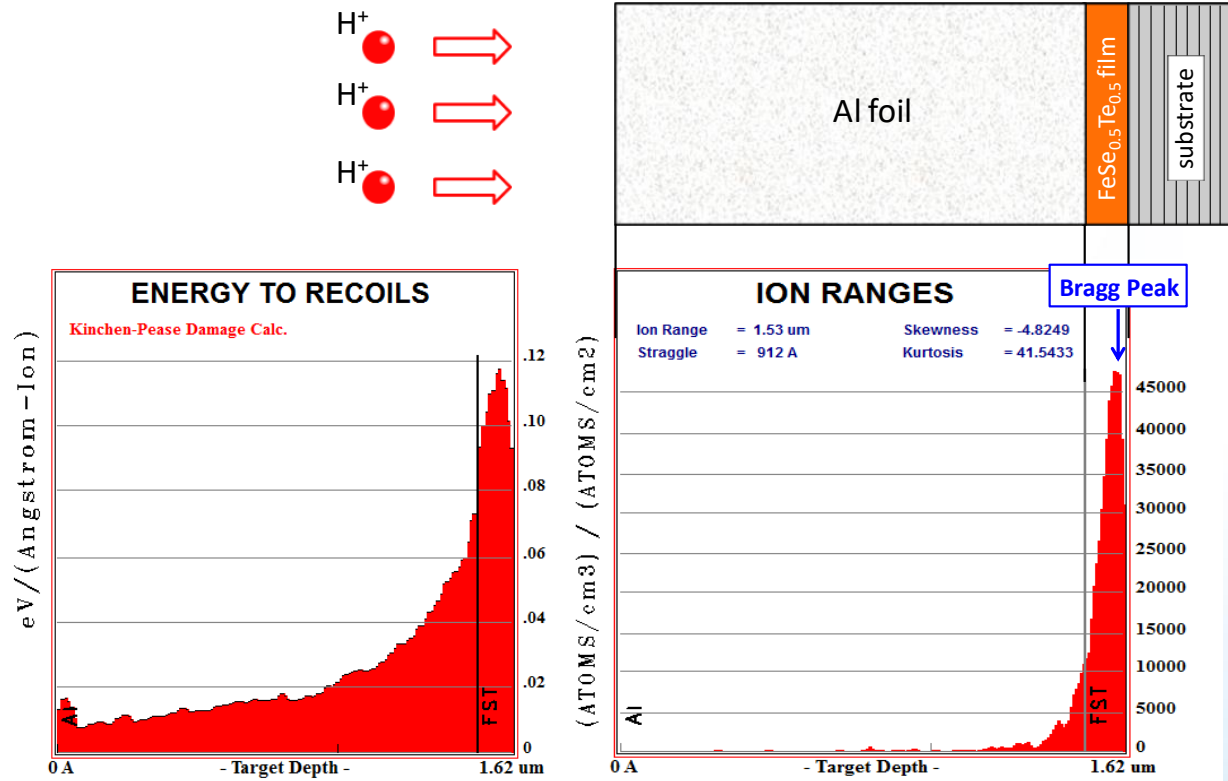

**Ionization loss (heating)**

**Recoil loss (defect generation)**

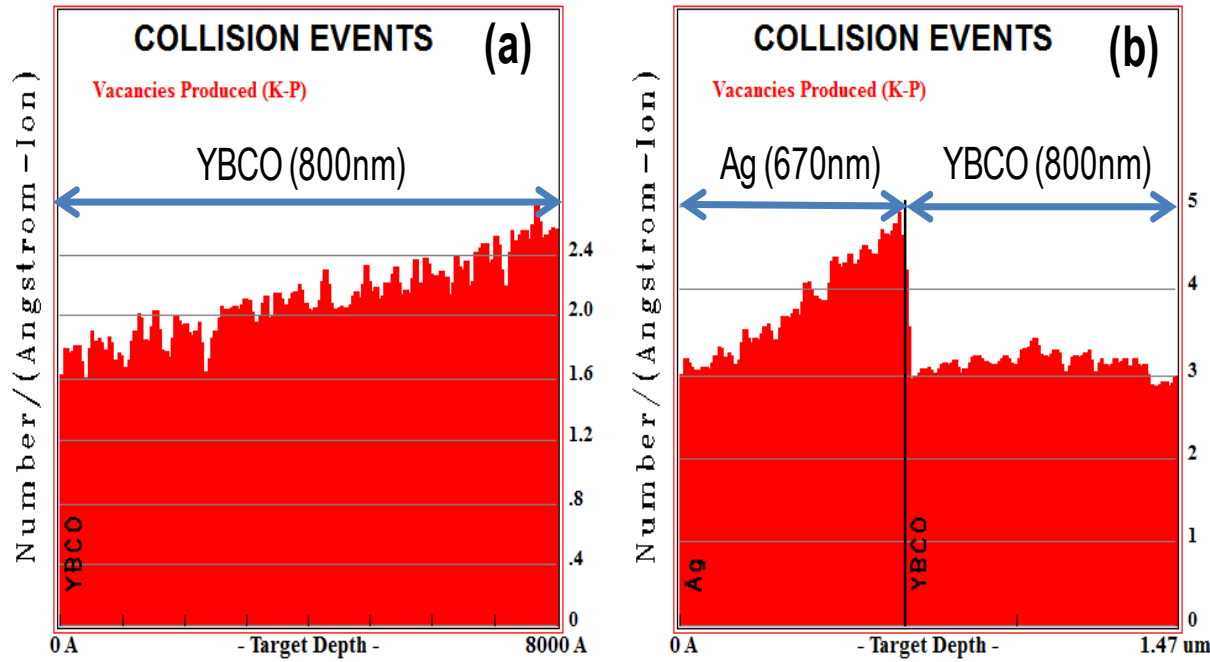

- ✓ Heavier ions offer potentially more efficient defect generation
- ✓ Lower doses can reduce the beam heating issues
- ✓ For Ar and Au the ion energy is set at the lowest level: the Bragg peak at YBCO-substrate interface

# Ion irradiations

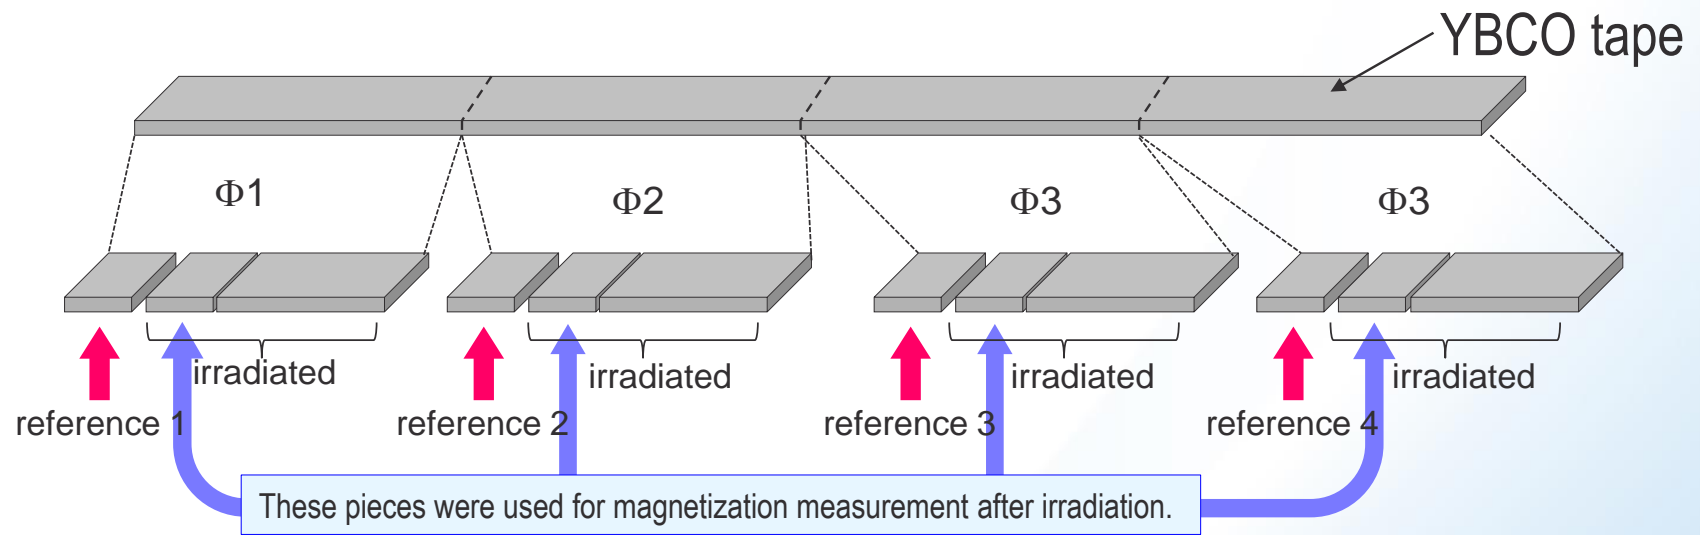

Energy to recoils and ion ranges of 190 KeV in FST films (120 nm) covered by Al foil (1.5 μm) simulated by SRIM 2008.

# Ion irradiations

Recoil collision events as a function of target depth inside 800 nm thick YBCO film (a), and a stack of 670 nm Ag on top of 800 nm thick YBCO film irradiated by 12 MeV  $\text{Ag}^{4+}$  ions, calculated with 10,000 incident ions. (Ozaki and Li, unpublished)

# Optimizing the dosage for 2G YBCO tape

# Uniformity of irradiation for 2G YBCO tape

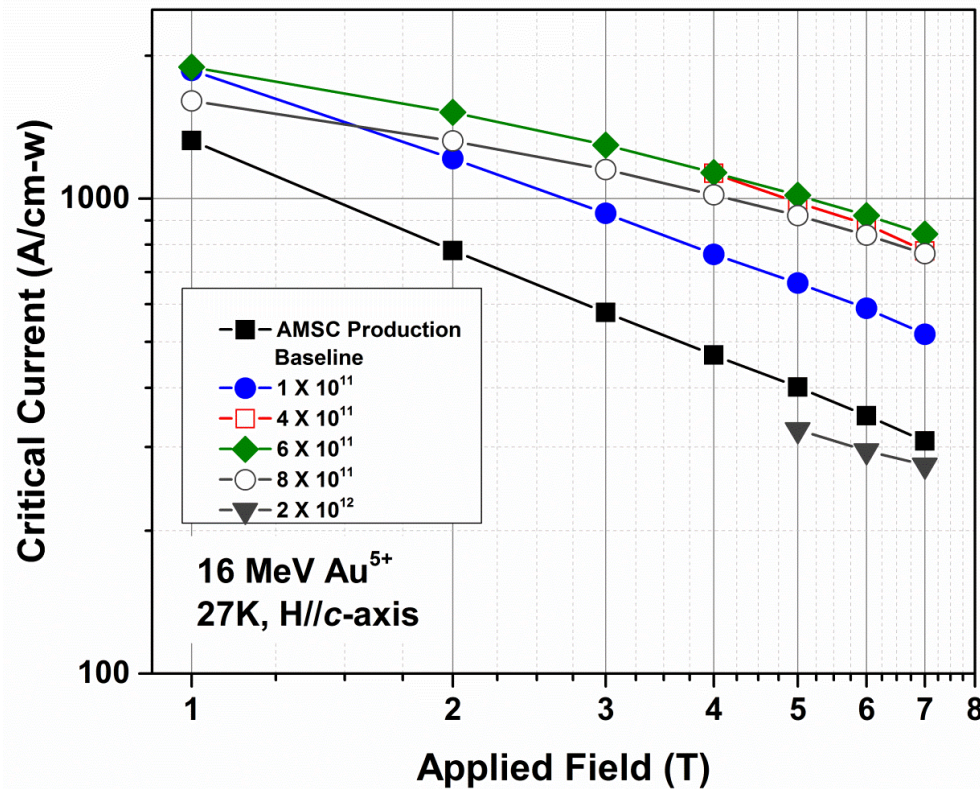

The irradiated area on the clear plastic tape shows light brown color after exposed to irradiation ( $\text{Au}^{5+}$ , 18 MeV,  $5 \times 10^{11}$  ion/cm<sup>2</sup>). The whole tape was optically scanned to check the irradiation uniformity. Small pieces of 2G tapes had been cut and placed at various places to check  $J_c$ .

# Au Ion Irradiation of Production Line Coated Conductors

Tandem Van de Graaff accelerator at Brookhaven National Laboratory

Sample chamber  
**BROOKHAVEN**  
NATIONAL LABORATORY

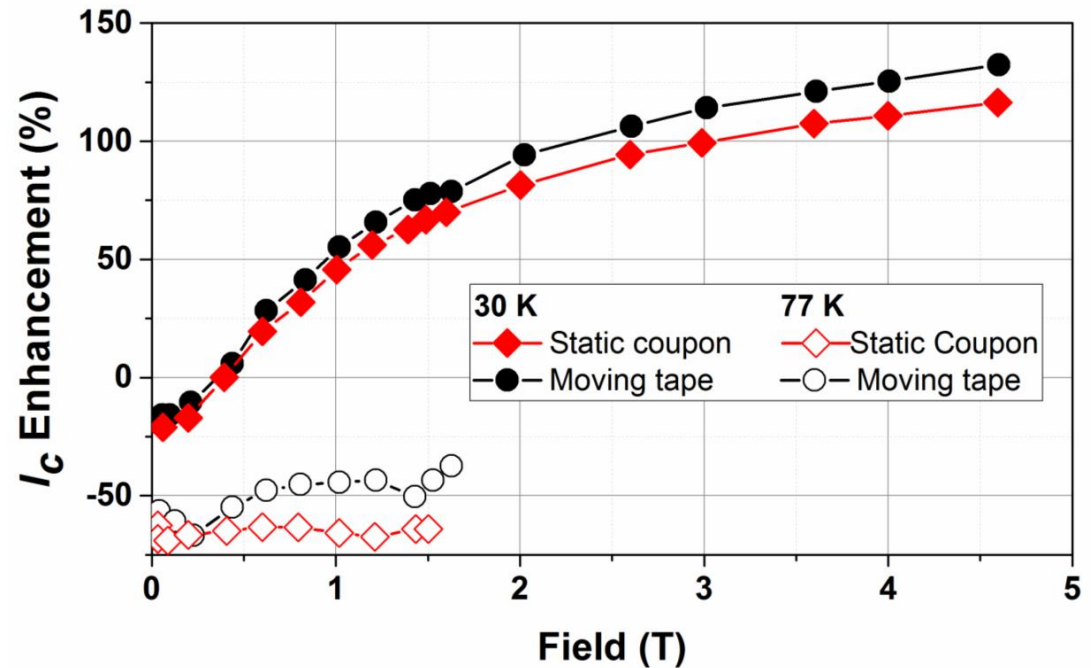

- Optimal dose ~  $6 \times 10^{11}$  Au ions/cm<sup>2</sup>
- Effective band width  $\pm 30\%$

# Static vs Roll-to-Roll Irradiation

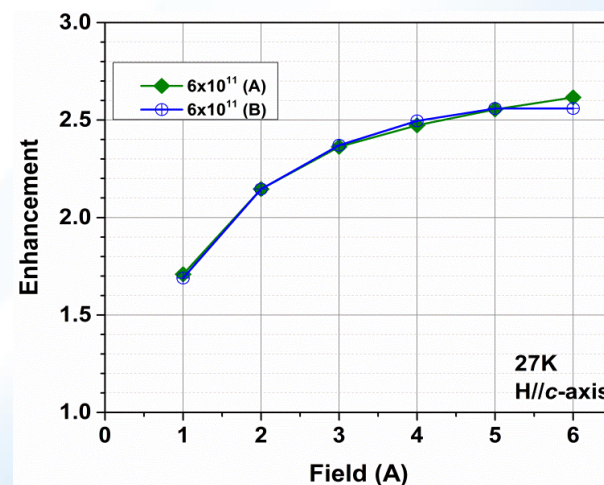

Static Sample (1 x 2cm) Irradiation

Moving Sample (1m x 1cm) Irradiation

# R2R Au Irradiation Optimization in 46 mm Wide Production Strip

# R&D Demonstration to “Production Length” Wire

Consistent change in  $I_c$  at 77K, sf confirms that irradiation dose and pinning is constant along length of wire

# Microscopic investigation of irradiation-induced pinning defects: TEM study (Wu & Li/DOE-BES)

Before Irradiation

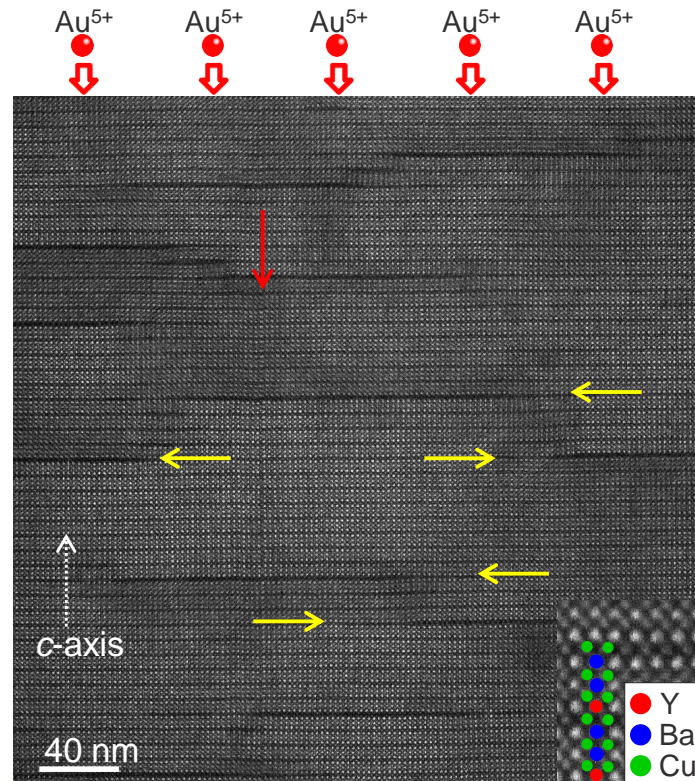

After 18 MeV, Au<sup>5+</sup> irradiation  
at  $6 \times 10^{11}$  ion/cm<sup>2</sup>

# Microscopic investigation of irradiation-induced pinning defects: TEM study (Wu & Li/DOE-BES)

18 MeV, Au<sup>5+</sup> irradiated YBCO tape,  $6 \times 10^{11}$  ion/cm<sup>2</sup>

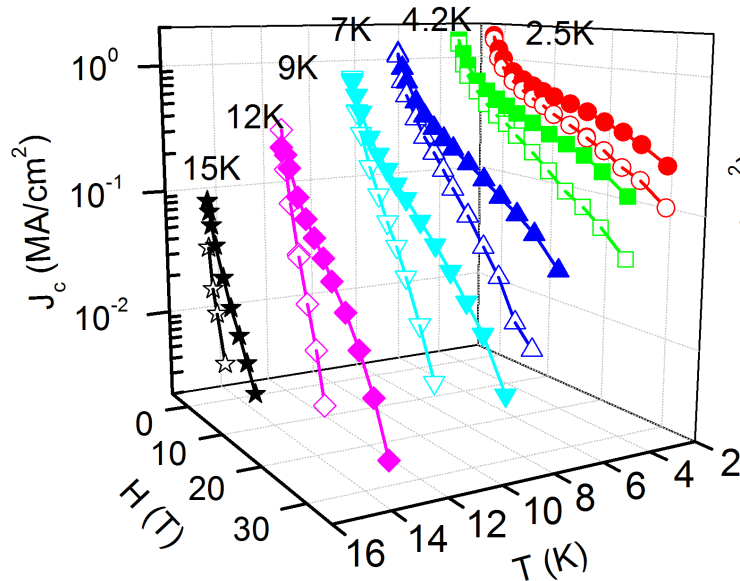

- ✓ The ripples (indicated by yellow arrows) are present between BaO-BaO layers
- ✓ Incident ions direction is indicated by red arrow

# FeSe<sub>0.5</sub>Te<sub>0.5</sub> coated conductors

(a) FeSe<sub>0.5</sub>Te<sub>0.5</sub>/CeO<sub>2</sub>/YSZ

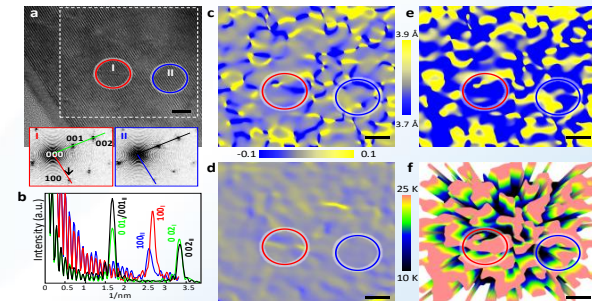

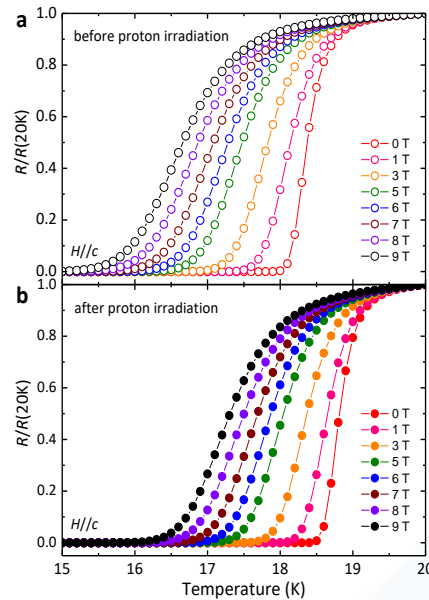

(b) FeSe<sub>0.5</sub>Te<sub>0.5</sub>/RABiTS

Si, QL, et al Nature Communications 4, 1347 (2013)

# Simultaneous increase of $T_c$ and $J_c$ in $\text{FeSe}_{0.5}\text{Te}_{0.5}$ superconducting films by 190 KeV proton irradiations

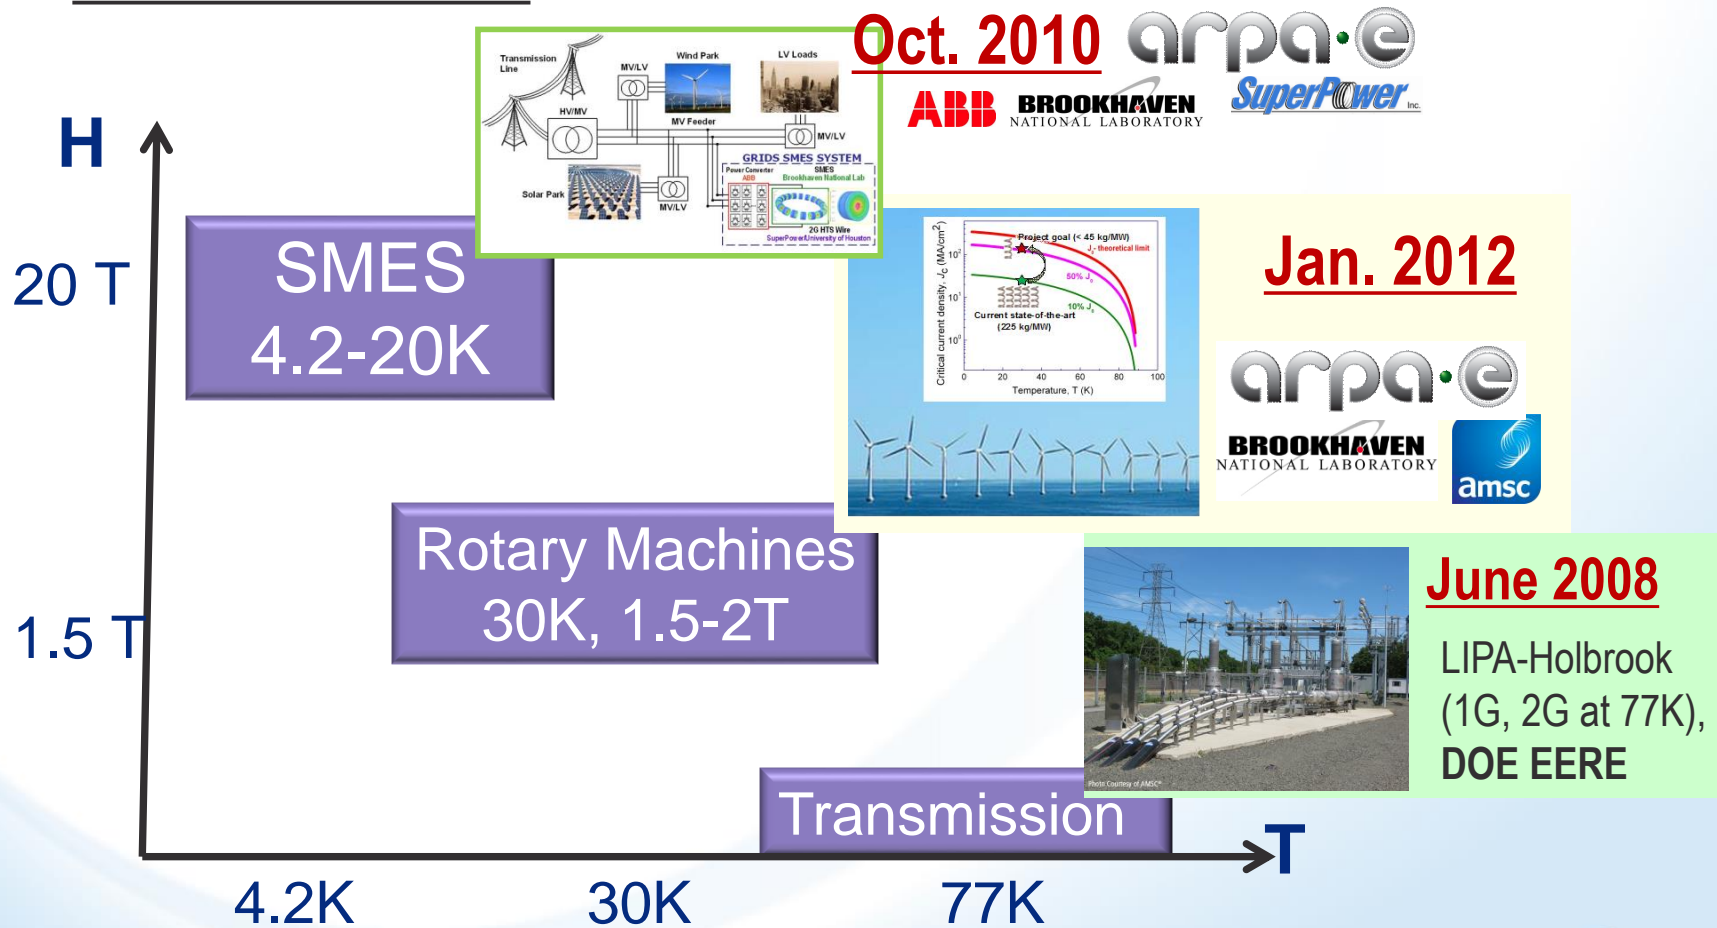

T. Ozaki, QL, et al Nature Communications, doi:10.1038/ncomms13036 (2016)

# Challenges for Cuprate HTS wires and cables

No wire fits all

# Summary

- Superconductivity, as a powerful energy carrier, can be used to provide many transformative solutions to the key challenges in renewable energy
- Doubling in-field critical current in cuprate HTS coated conductors is demonstrated by a roll-to-roll ion irradiation process
- Significant progress has been made for 2G wires and cables. No one wire fits all yet --- whether it is desirable is another question.

**$T_c$ ,  $H_{c2}$ ,  $J_c$ , and anisotropy are limiting factors for large-scale application of superconductors**

Q. Li et al - Rep. Prog. Phys. 74 (2011) 124510
